Summary

Python Developer who builds complete applications from the database to the user interface. Hands-on experience with **FastAPI**, **SQLAlchemy**, **PostgreSQL** and **React**, along with broker APIs, Telegram bots, scheduled jobs and data pipelines. Built a systematic investing platform with live broker integration and a team standup bot used through Telegram. Looking for a Python Developer role where I can write clean, tested code and keep learning.

Education

Nalanda Degree College **CGPA: 7.0**
Bachelor of Science (B.Sc.) *Vijayawada, Andhra Pradesh*

Narayana Junior College **CGPA: 8.65**
Intermediate (MPC) *Gudavalli, Andhra Pradesh*

Narayana School **CGPA: 9.3**
SSC (Class 10) *Gannavaram, Andhra Pradesh*

Projects

Systematic Investing Platform | *Python, FastAPI, SQLAlchemy, pandas, React, Fyers API* **GitHub**

- Built a rule-based investing system that ranks NSE stocks by 6-month momentum every two weeks, holds the top 5, and moves to cash when the market turns weak.
- Built a data pipeline that downloads daily prices for **2,700+ NSE stocks** from the official NSE file and stores them with SQLAlchemy; a scheduler runs it automatically every weekday evening.
- Developed a paper-trading engine that plans orders after market close, fills them at the next day's open, and reinvests profits.
- Integrated the **Fyers broker API** for live prices and live P&L, with real orders locked behind safety checks and a per-order limit; added Telegram alerts for every trade.
- Created a **FastAPI** backend with 12 REST endpoints and a **React** dashboard showing holdings, live profit, planned orders, the top 10 ranked stocks and a performance chart against Nifty 50.
- Designed the database with SQLAlchemy models for prices, positions, orders, trades and daily account value; handled stock splits in raw NSE data with a simple one-day-fall check.
- Researched and **backtested 25,000+ strategy variations** on 7 years of NSE data, including delisted stocks, after brokerage, slippage and tax, using out-of-sample checks before choosing the final rules.
- Wrote **10 pytest tests** for the strategy, broker and API, and containerised the backend with Docker and Docker Compose.

Standup Bot | *Python, FastAPI, SQLAlchemy, PostgreSQL, Telegram Bot API, React* **GitHub**

- Built a **Telegram bot** that collects daily team standups (yesterday, today, blockers) and stores them in **PostgreSQL** using SQLAlchemy.
- Added scheduled jobs: a 10 AM reminder to members who have not submitted, and a Friday weekly summary for each person.
- Sent instant Telegram alerts to the manager when someone reports a blocker; added /edit and /cancel commands.
- Built a FastAPI REST API and a React dashboard with search by name, date filter, a "missing today" list and auto-refresh every 5 seconds.
- Tracked each user's place in the 3-question conversation, so many team members can answer the bot at the same time without mixing answers.
- Used the python-telegram-bot **job queue** with Indian time zone handling for the daily and weekly jobs, and kept secrets such as the bot token in environment variables.

Technical Skills

Backend: Python, FastAPI, REST API design, SQLAlchemy ORM, Pydantic, Telegram Bot API

Databases: PostgreSQL (schema design, joins, indexing), MySQL

Frontend: React (Hooks, API integration), JavaScript (ES6+, async/await), HTML, CSS

DevOps and Testing: Docker, Docker Compose, Git, GitHub, pytest

Data: pandas, NumPy

AI-assisted development: Claude Code, ChatGPT (debugging, code review, faster delivery)

Concepts: OOP, REST APIs, HTTP, CRUD, database design, scheduled jobs, data pipelines, unit testing
